Project Idea Submission Form

Course Learning Objectives (CLOs)

Submission evaluation is based on the following core objectives:

- **CLO-1:** Apply technical, teamwork, and project management practical skills.
- **CLO-2:** Identify and solve real-world problems.

Project Details

Field	Student Input Area
Project Title:	SignBridga AI
Project Description:	This project is an AI-based website that translates sign language into text and voice in real time using a camera. It helps reduce communication barriers between deaf individuals and others, making communication easier in daily life.
Group Name:	210
Project Group Members (Name, ID):	abdullah alenezi 230200017 Hamad alhmli 230100180 Hamad alajmi 230100173 Rashed Alfoudari 230100113

Project Idea Questionnaire

Instructions: Please provide comprehensive answers to each question in the "Student Response" column. Ensure your responses demonstrate how the project meets the requirements for CLO-1 and CLO-2.

#	Questions	Student Response Column
1	**What is new in your project?** What makes your project different or creative? How does it use new technology?	Our project is different because it uses Artificial Intelligence and real-time video recognition to translate sign language instantly into written and spoken text. Unlike normal translation apps, our system focuses specifically on the deaf community and provides fast, accurate, and automatic translation through a website. The creative part is combining AI, camera recognition, and instant communication in one
2	**Why should someone invest in your project?** How does your project help save time, money, or reduce the need for workers?	Investing in this project is valuable because it reduces the need for full-time sign language interpreters in many places such as hospitals, banks, universities, and government offices. It saves time and money by providing instant translation without waiting for a human interpreter. It also increases service efficiency and improves customer satisfaction.
3	**How does your project help people or the community?** Does your project solve a real problem or make life better for others?	Our project solves a real communication problem between deaf people and those who do not understand sign language. It makes daily communication easier in schools, workplaces, hospitals, and public places. This improves inclusion, independence, and confidence for the deaf community.
4	**Why did you choose this project?** What made you interested in this idea? Is there a story or reason behind it?	We chose this project because communication is a basic human need. Deaf individuals often face difficulties when interacting with society. We wanted to create a solution that supports them and reduces communication barriers. Our goal is to make technology serve humanity in a meaningful way.
5	**What does your project do?** Explain in a simple way what your project does and how it works.	The project is a smart website that uses a camera to detect sign language gestures. The system analyzes the hand movements using Artificial Intelligence and converts them into text and voice instantly. This allows hearing people to understand what the deaf person is saying in real time
6	**Who is your project for?** Who will use your project? Why is it useful for them?	The project is mainly for deaf and hard-of-hearing individuals. It is also useful for companies, government institutions, schools, and hospitals that serve deaf customers or students. It helps both sides communicate easily.
7	**When can your project be used?** Is your project helpful now, in the future, or only at certain times?	The project can be used anytime and anywhere as long as there is internet access and a camera. It is useful now and will continue to be important in the future as technology and AI continue to develop.
8	**How would you build your project?** What tools, steps, or ideas did you use to make your project?	We will build the project using: • A website interface (Front-end) using HTML, CSS, and JavaScript • A back-end system for processing data • Artificial Intelligence and Machine Learning models for gesture recognition

9	**How do you plan to make your presentation interesting?** What will you say or do to make people listen and believe in your idea?	We will start by showing a short real-life scenario where communication is difficult between a deaf person and a service employee. Then we will demonstrate our website live or through a short video. We will explain how the system works in a simple and clear way, focusing on the problem and how our solution solves it.
10	**What is the big goal of your project?** If your project becomes successful, what good changes could it bring?	The main goal is to reduce communication barriers between deaf individuals and society. If successful, the project could improve social inclusion, increase independence for deaf people, and encourage more technological solutions for people with special needs.

Instructor Grading Rubric (Total Score: 5)

Assessment Criteria	Excellent (1.0 pt.)	Satisfactory (0.6 pt.)	Needs Improvement (0.2 pt.)
CLO-1: Technical & Management	Comprehensive detail on tools, steps, and project management strategy.	Mentions some tools/steps; management plan is vague.	Minimal technical details or execution plan provided.
CLO-2: Problem Solving	Highly effective solution for a clearly defined real-world problem.	Identifies a basic problem with a standard or generic solution.	Problem is not clearly defined or solution is irrelevant.
Originality & Creativity	Project is highly unique and creative; clearly differentiates itself from existing solutions.	Project shows some creative elements but is similar to existing ideas.	Project lacks originality or is a direct copy of common ideas.
Investment Value	Clear evidence of time/money savings and high efficiency benefits.	Moderate evidence of practical benefits to users or business.	Lacks clear value or fails to show efficiency gains.
Clarity & Completeness	All 10 questions answered thoroughly; goals are realistic and clear.	Most questions answered; responses lack depth or detail.	Responses are vague; project scope is not feasible.
